

➤ Predicting the risk of establishment of the invasive beetle *Popillia japonica* in Europe

Davide MARTINETTI – INRAE, UR BioSP – Avignon

ModStatSAP – Paris, September 19th, 2023

> Outline

1. The 4 "W" of *Popillia japonica*

- Who?
- Where?
- When?
- Why?

2. Species distribution model with opportunistic citizen-science data

- Presence-only data
- Sampling bias
- SDM
- Results

> Who
Popillia japonica

Japanese beetle

Scientific classification 

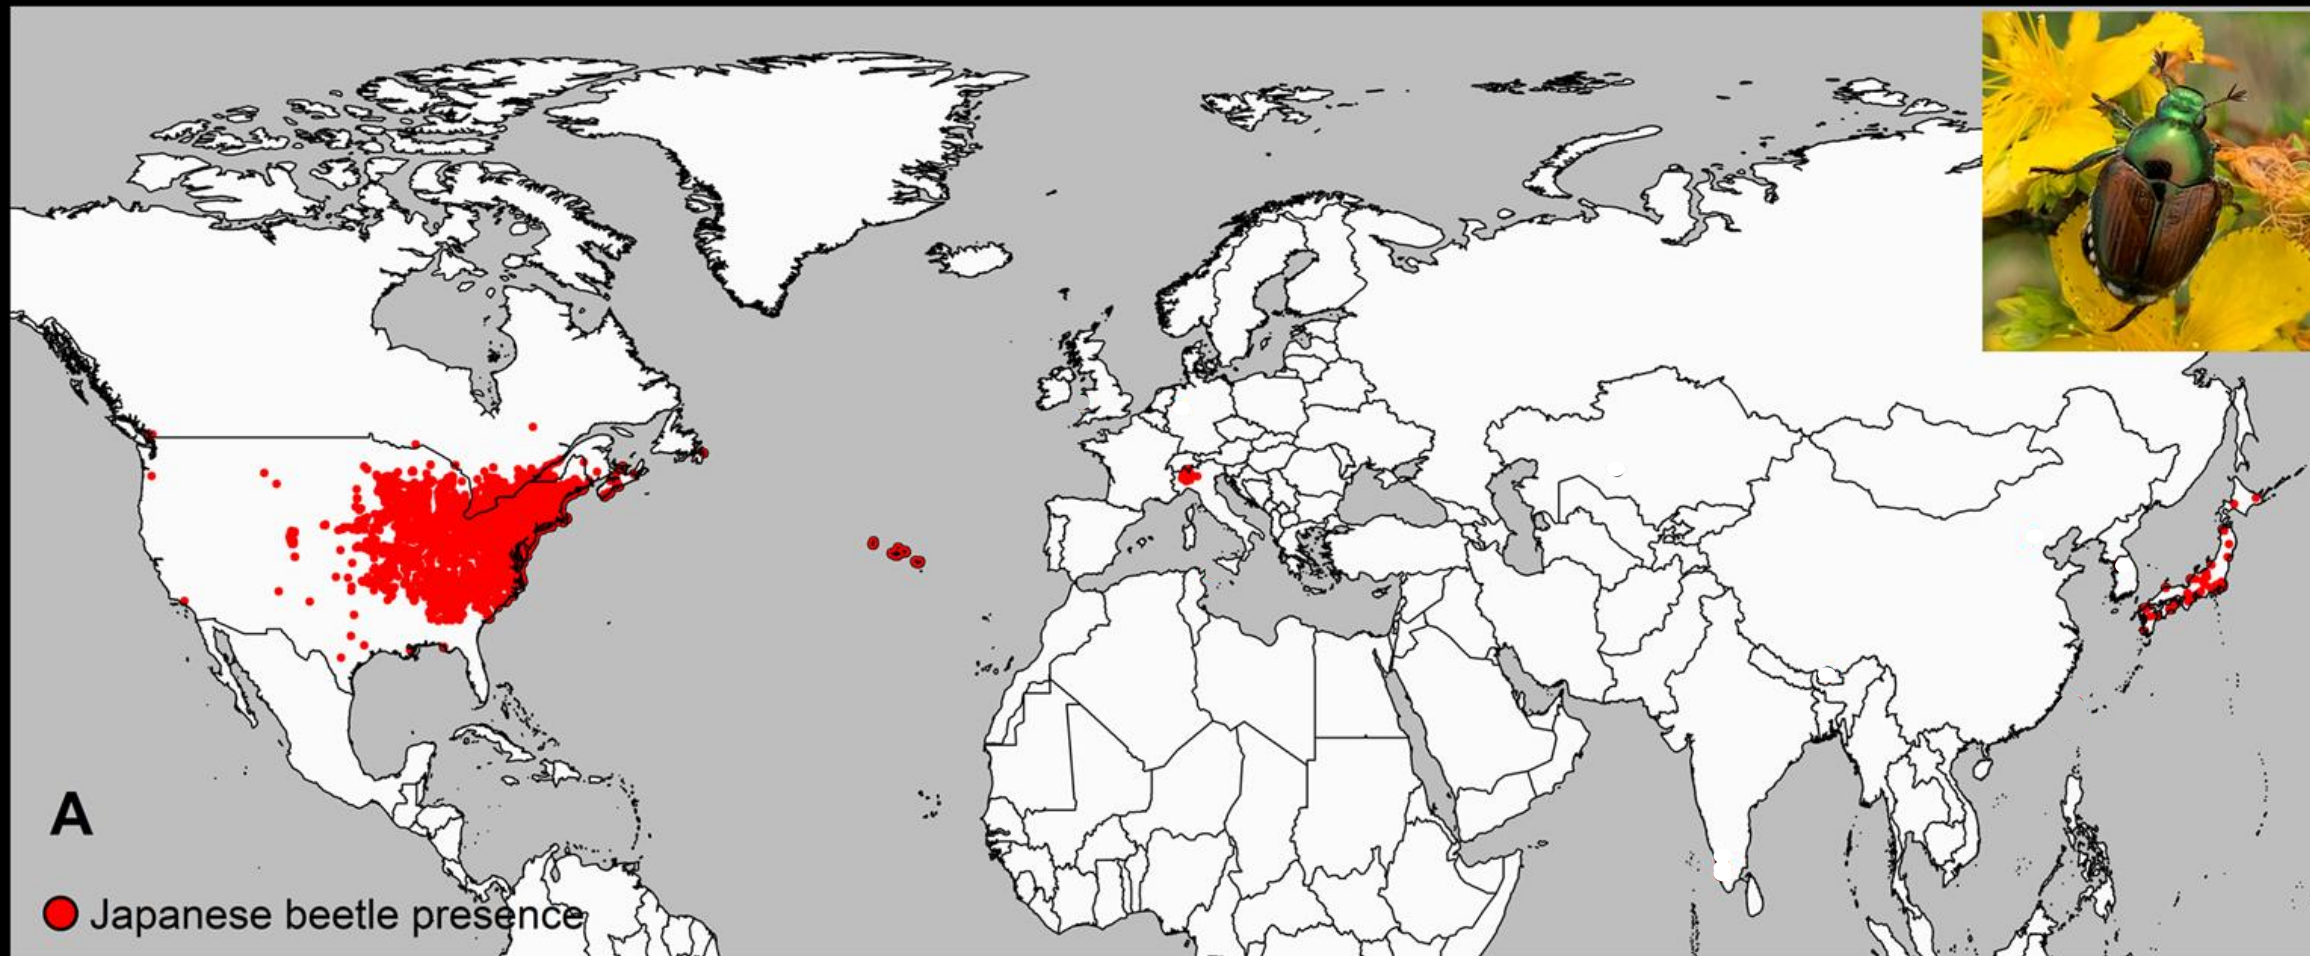

- Kingdom: Animalia
- Phylum: Arthropoda
- Class: Insecta
- Order: Coleoptera
- Family: Scarabaeidae
- Genus: *Popillia*
- Species: *P. japonica*

Binomial name

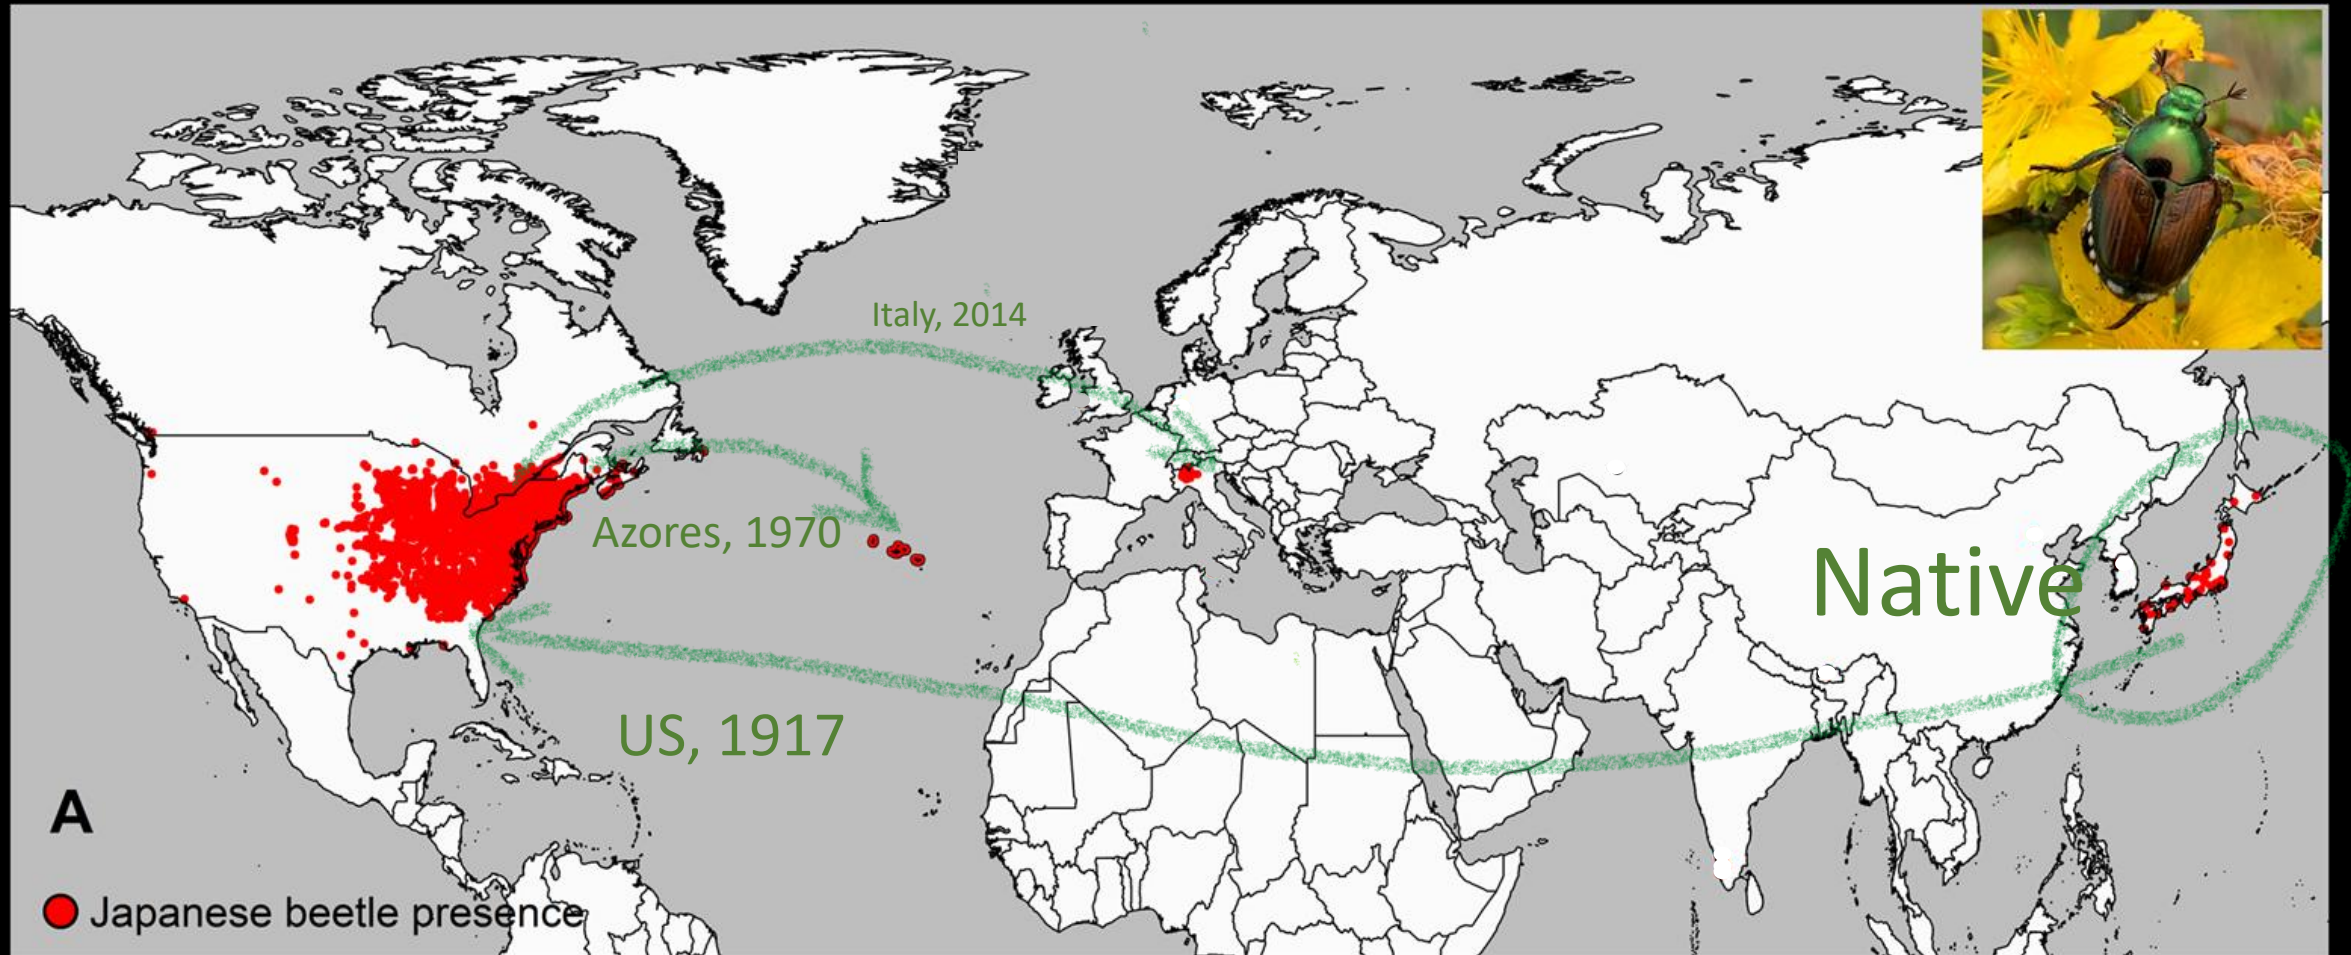

Popillia japonica

Newman, 1841

> Where

> When

> Why

Italy, July 2021

2015

STATUS

Italy, July 2021

Risk-based surveillance

Introduction

Establishment

Spread

Damage

Cost

SPECIES DISTRIBUTION MODEL

$$Y = f(X, \epsilon)$$

- $Y \in \{0,1\}$: presence or (pseudo-)absence of a certain species
- $X \in \mathbb{R}^n$: covariates
- ϵ : some kind of error
- $f: \mathbb{R}^n \rightarrow [0,1]$: some kind of function

OPPORTUNISTIC CITIZEN-SCIENCE DATA

Challenge 1
Presence-only data

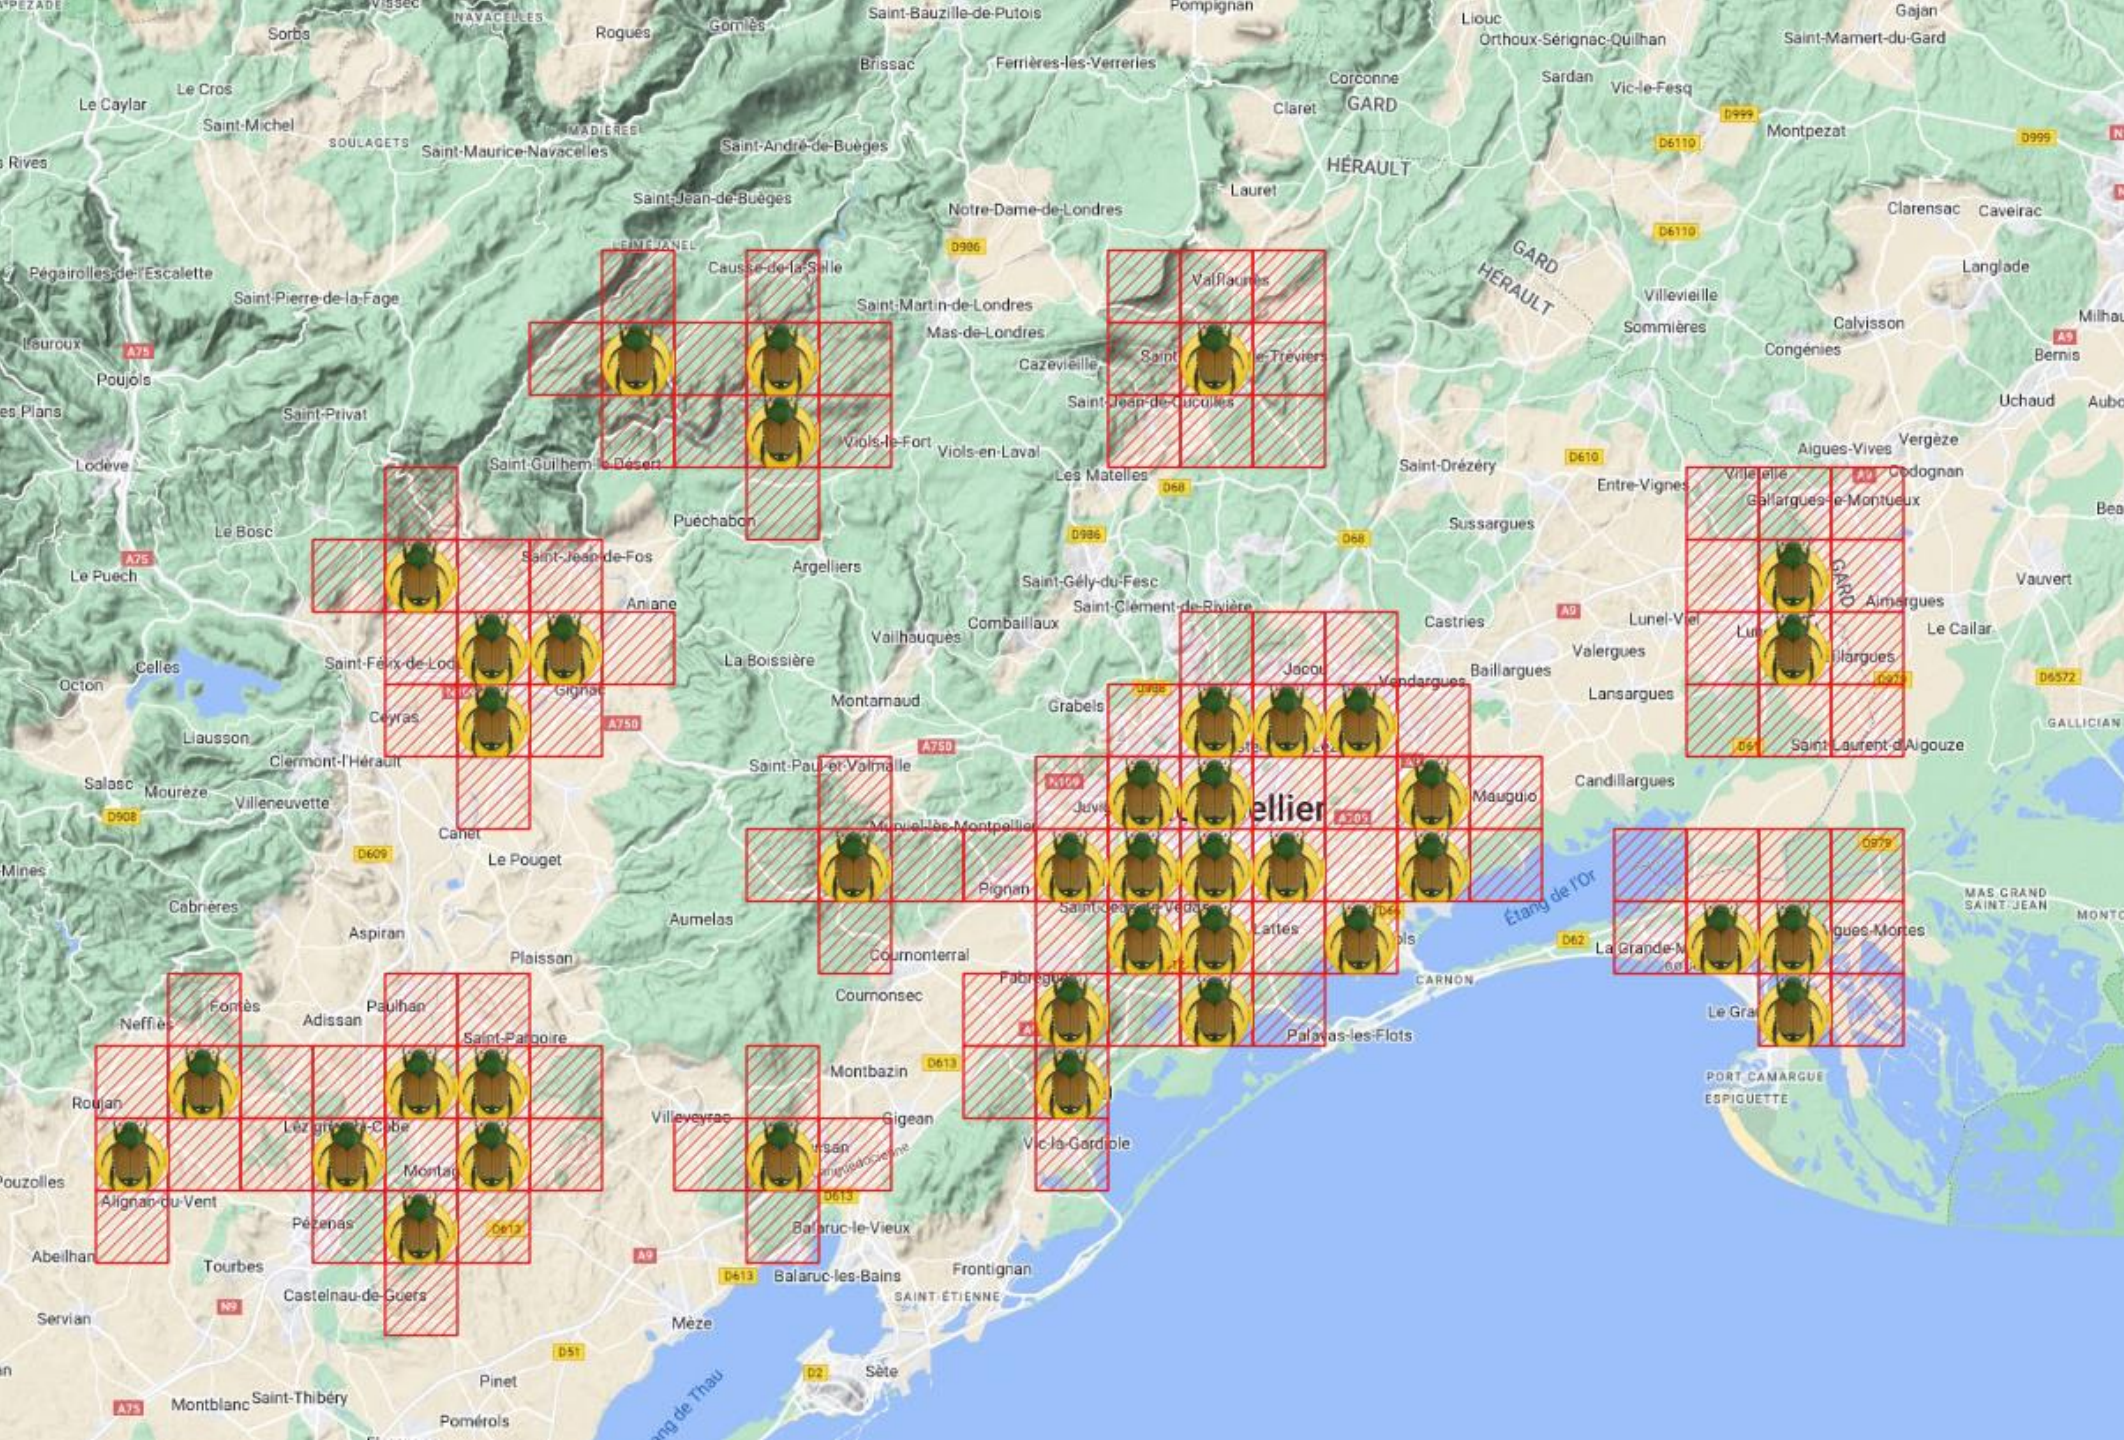

Legend

Presence

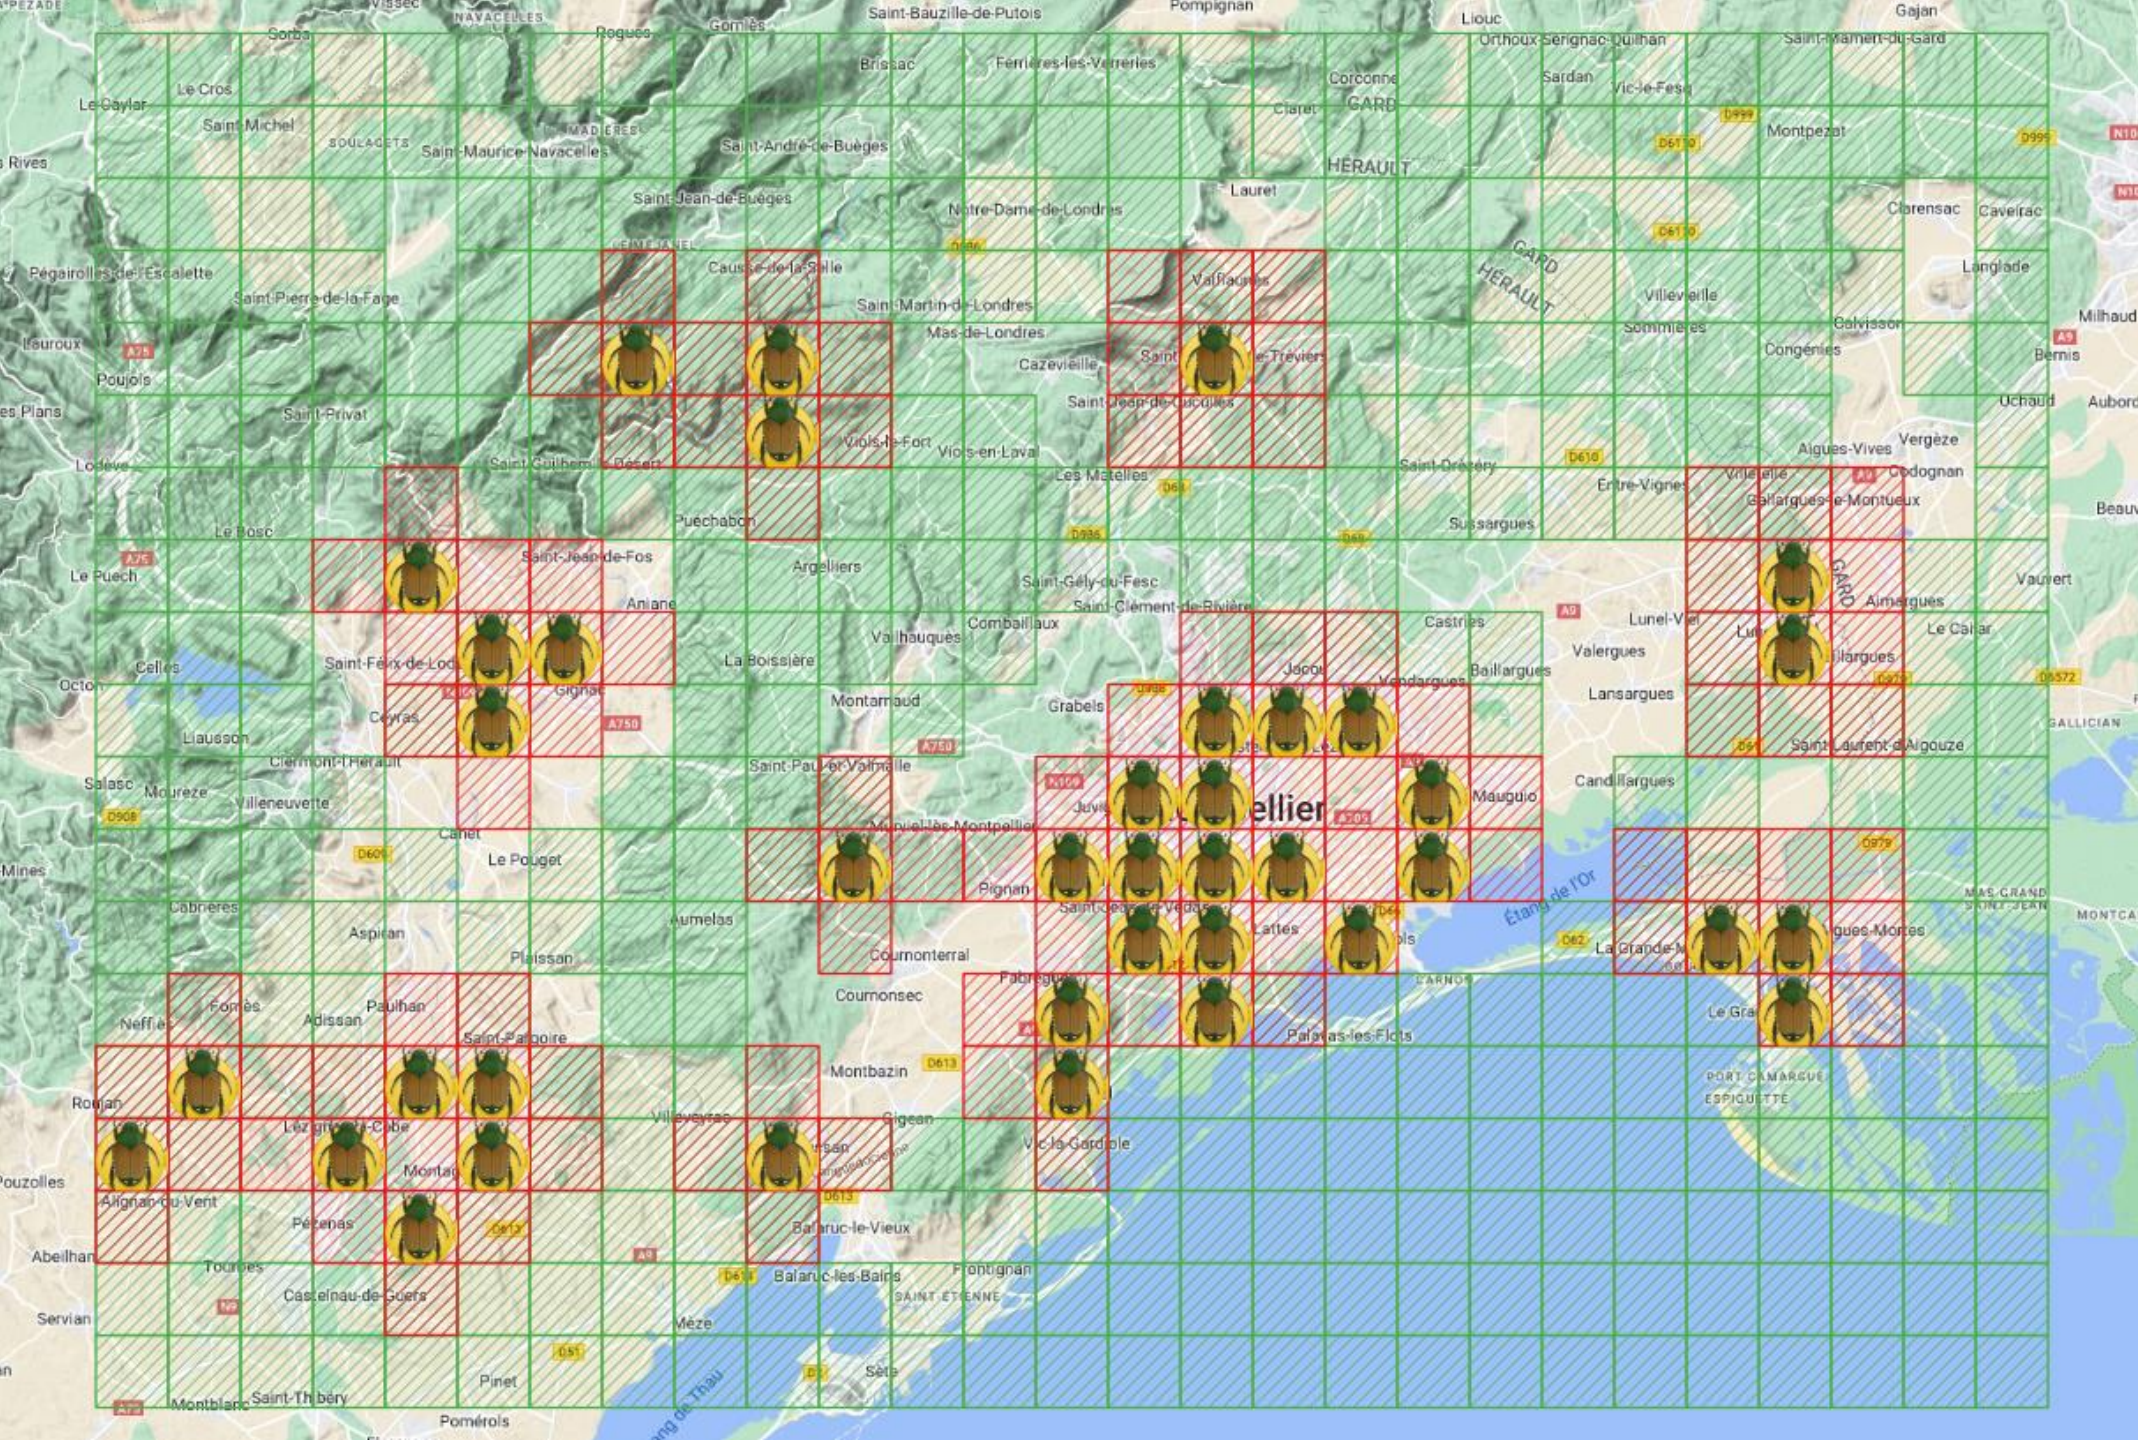

Legend

Presence

Neighbour

Legend

Presence

Neighbour

Pseudo absence

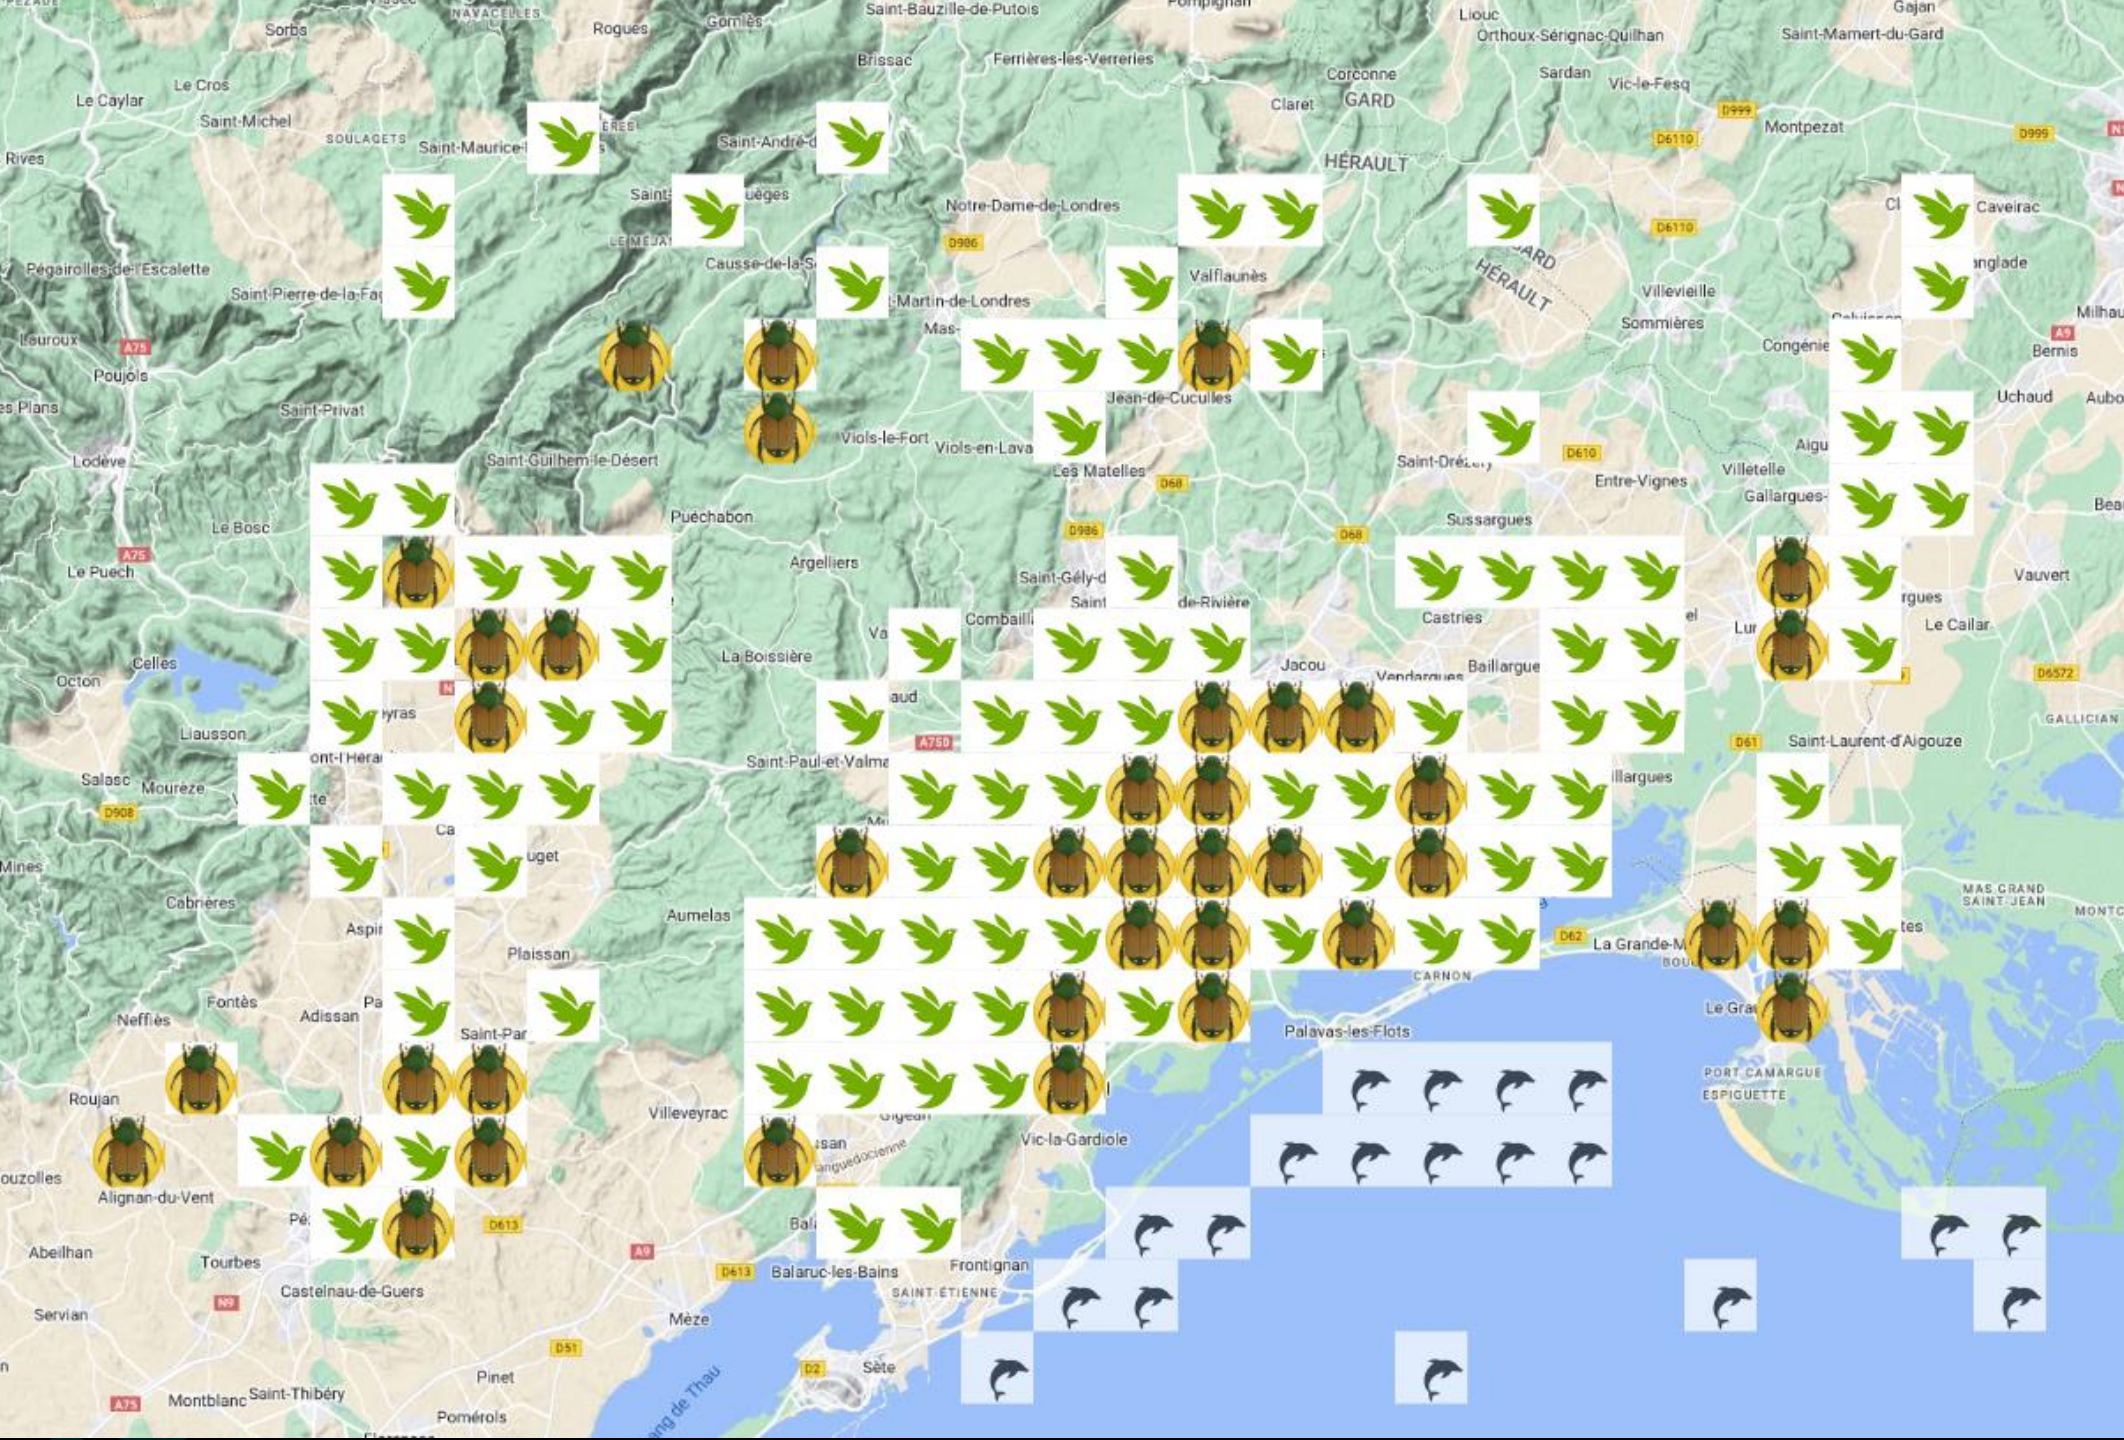

Take-home message

1. You may trust presence data...
2. ...but generate pseudo-absences **wisely**

OPPORTUNISTIC CITIZEN-SCIENCE DATA

Challenge 2 Sampling bias

Legend

Presence

Terrestrial

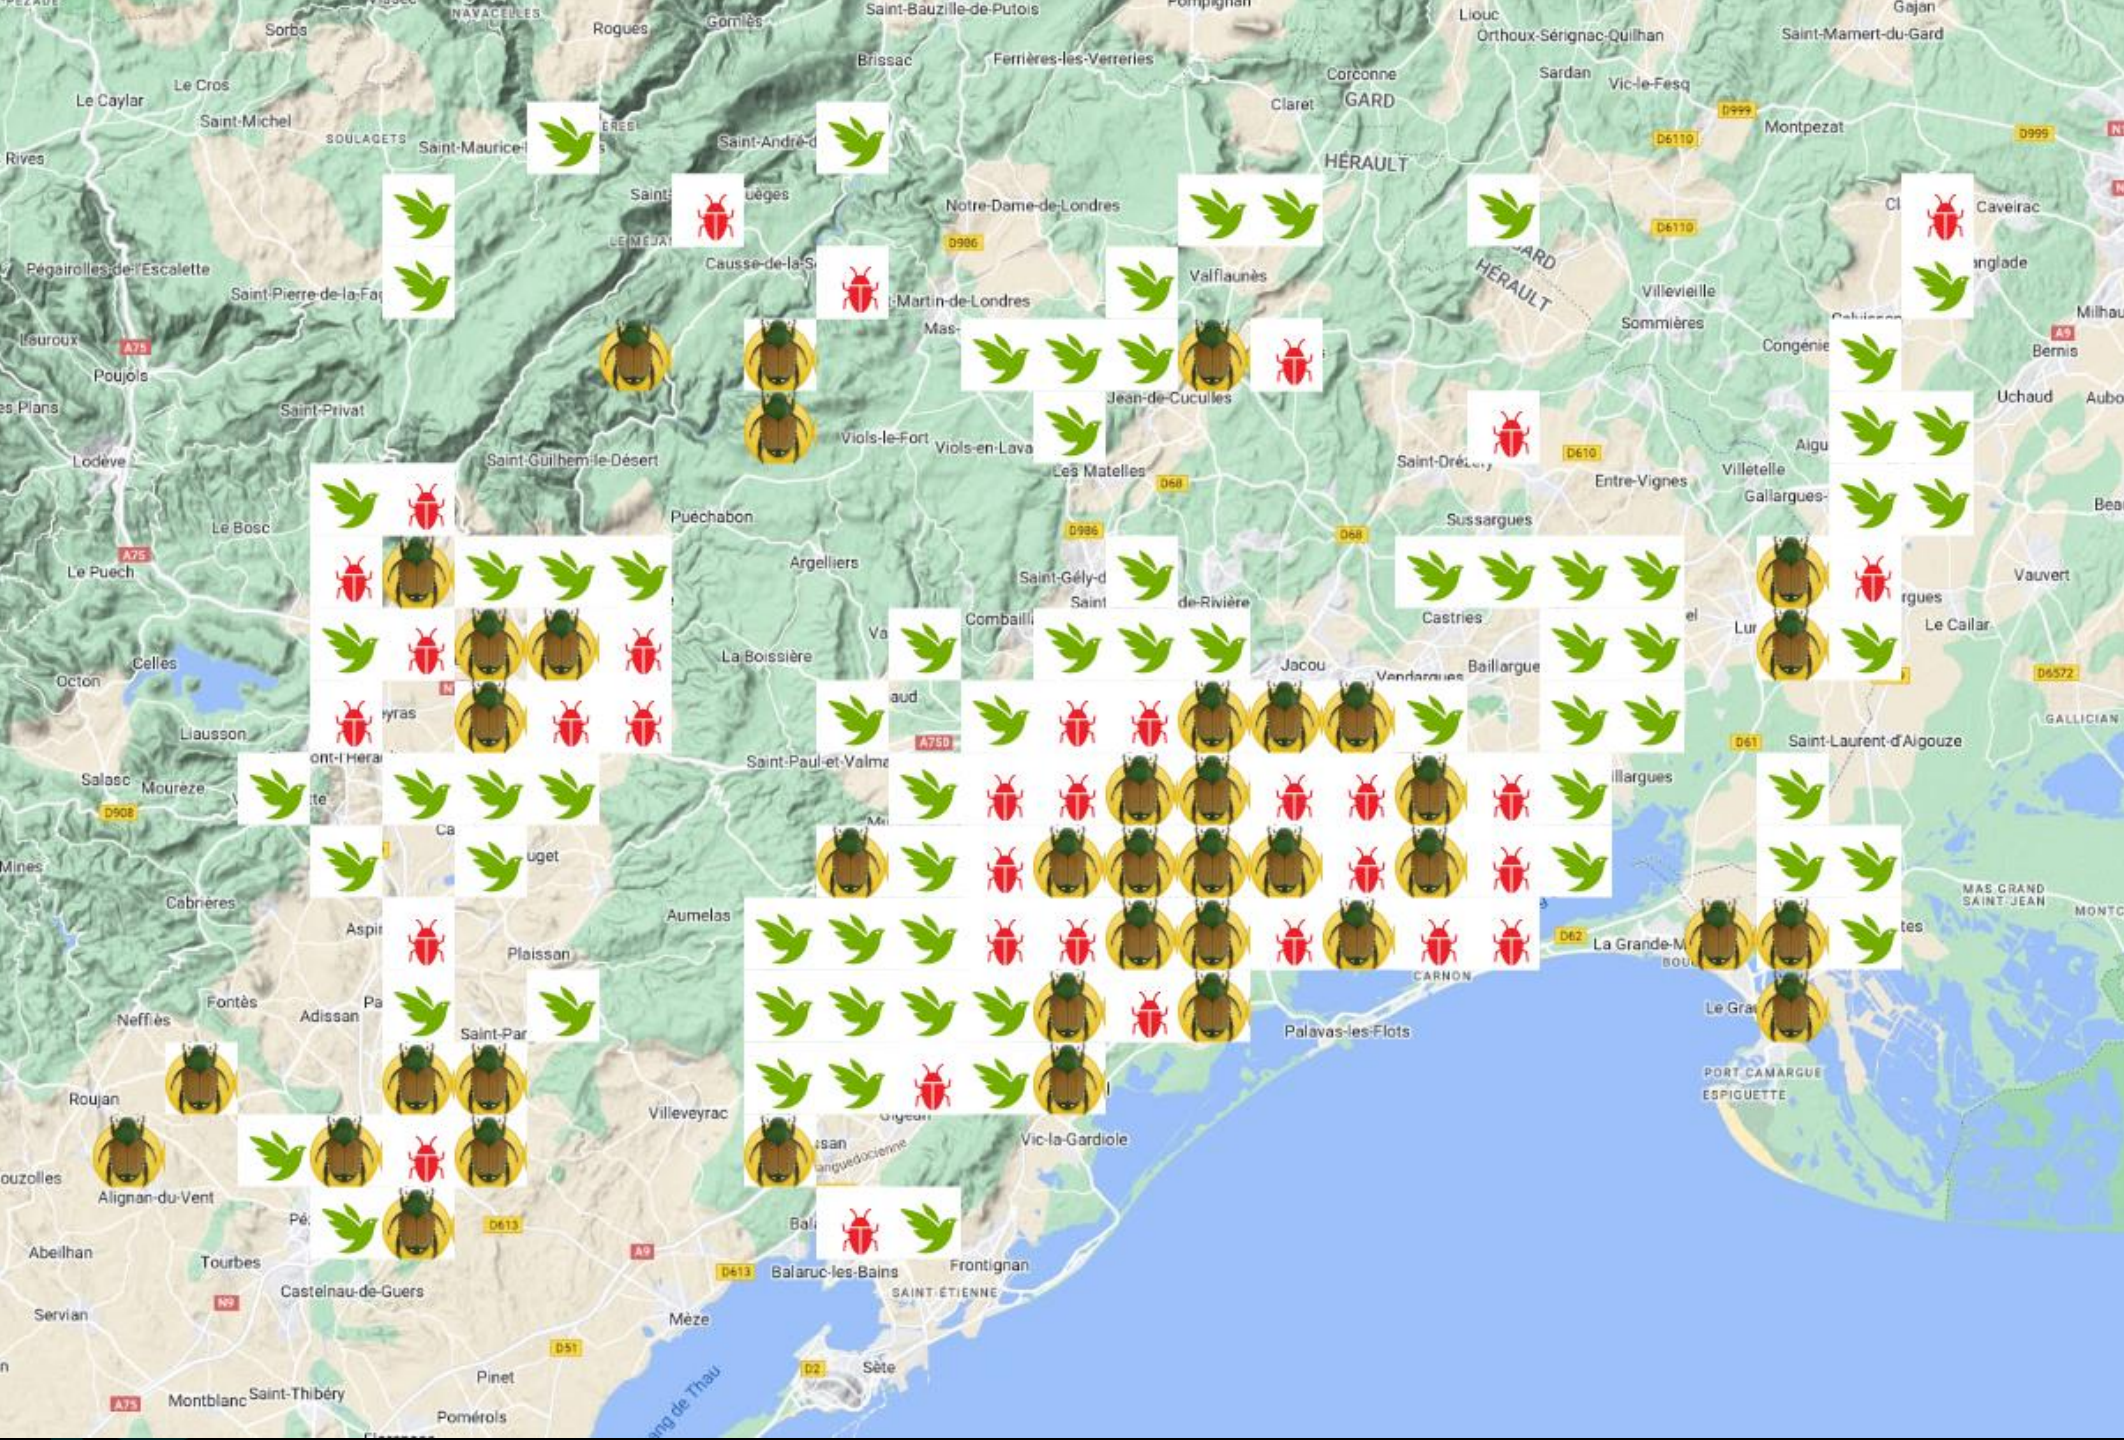

Marine

Legend

-  Presence
-  Terrestrial
-  Marine

Legend

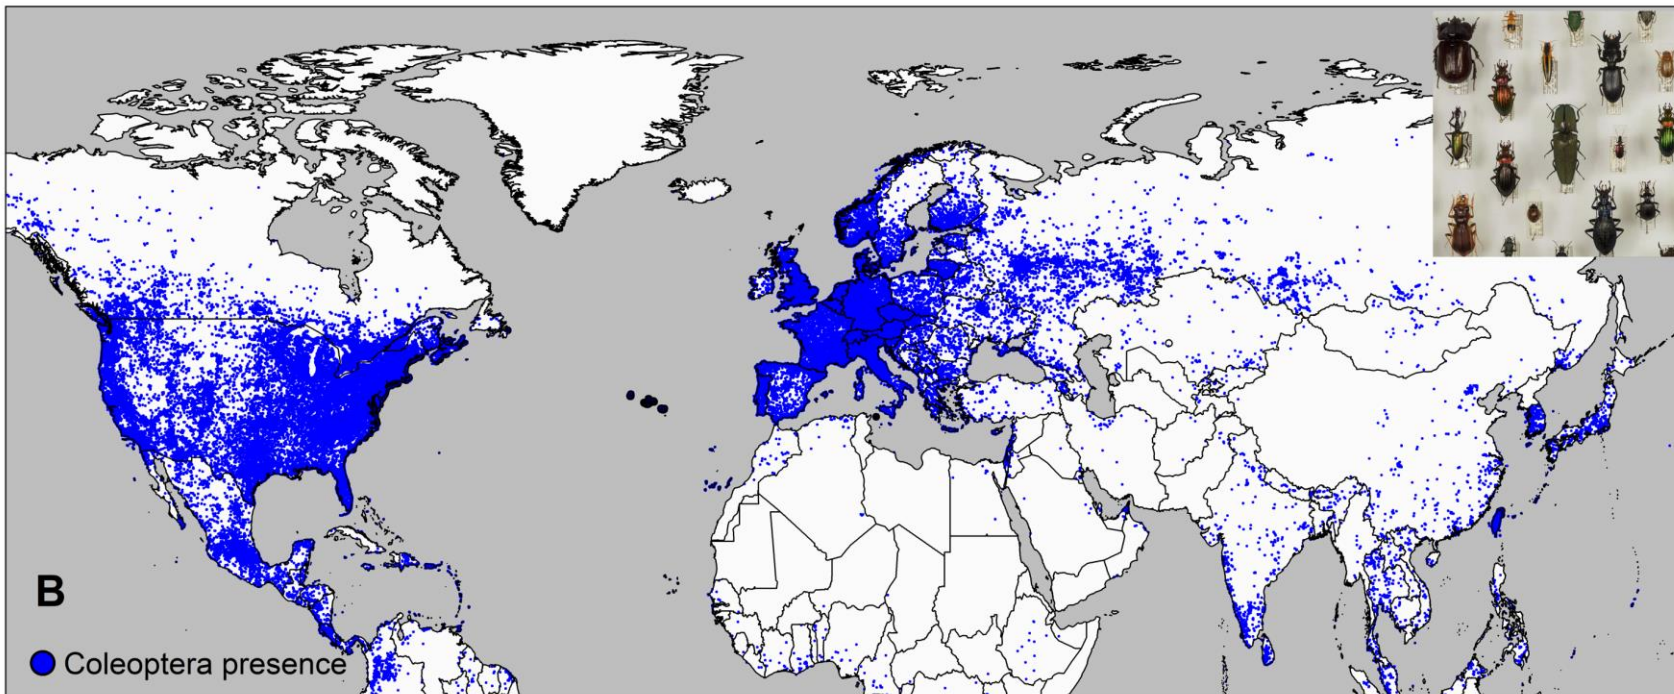

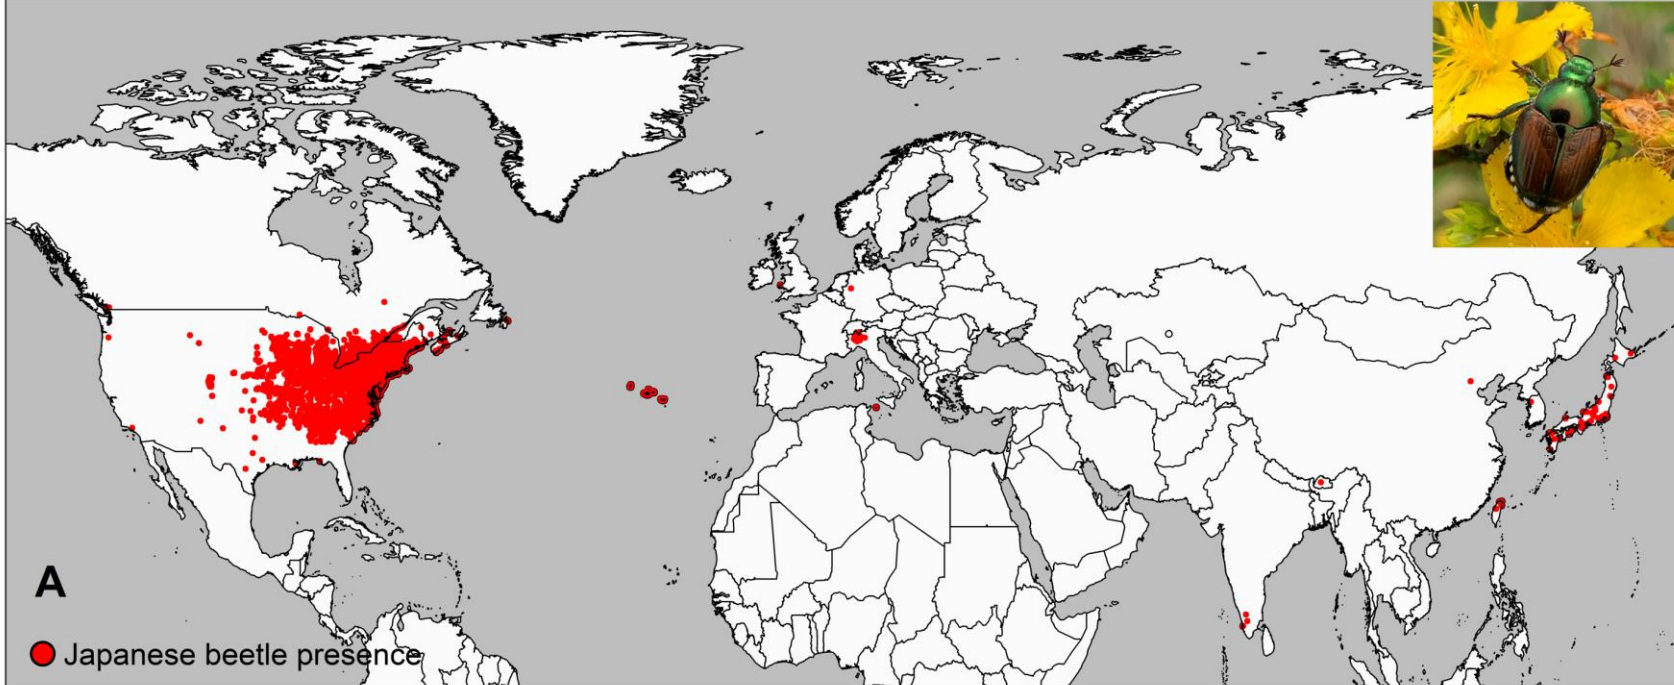

Presence

Terrestrial

Insects

Presences

(*Popillia japonica*)

6844 cells

much less than

Pseudo-absences

(*Coleoptera*)

49010 cells

Take-home message

- **Opportunistic data are abundant and ready to use...**
- **... but suffer from sampling bias**

Solution: Pseudo-absences using target-group¹ strategy

- Higher taxonomic level
- Same observers
- Same dates/period

> Covariates

> All my data

133 variables

55854
observations

Presence	Var_1	Var_2	Var_132	Var_133

No							

> Choice of the algorithm

BIOCLIM = Bioclimatic Analysis

GLM = Generalized Linear Model

GAM = Generalized Additive Model

MARS = Multivariate Adaptive Regression Splines

BRT = Boosted Regression Tree

RF = Random Forest

Good for unbalanced datasets ¹
Estimation of variable importance ²
Robust against multicollinearity ³

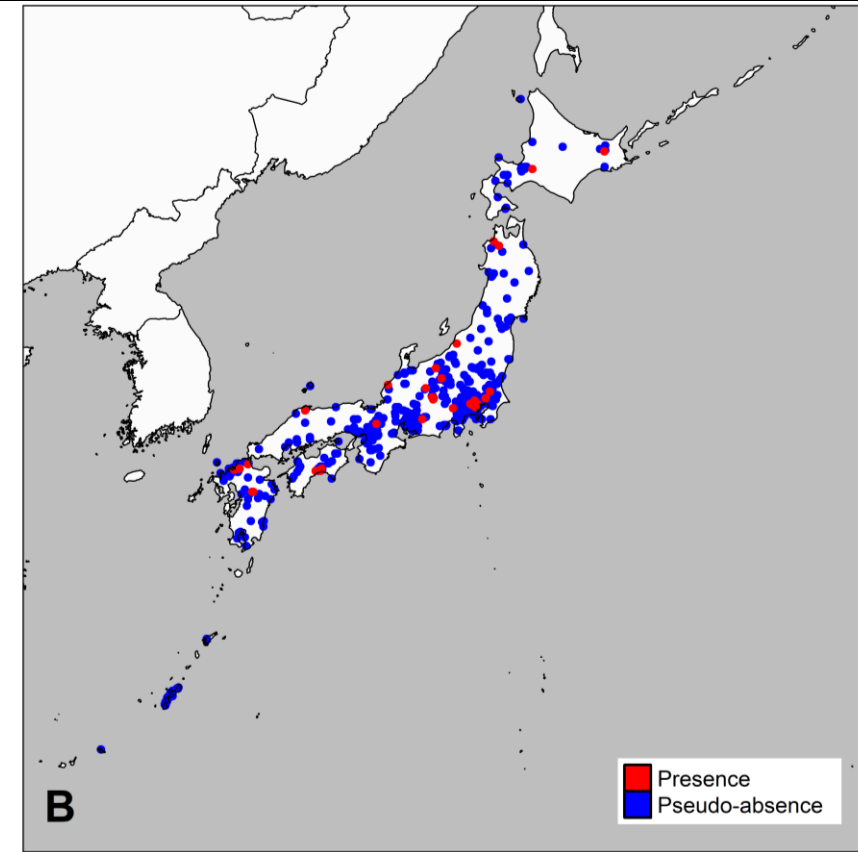

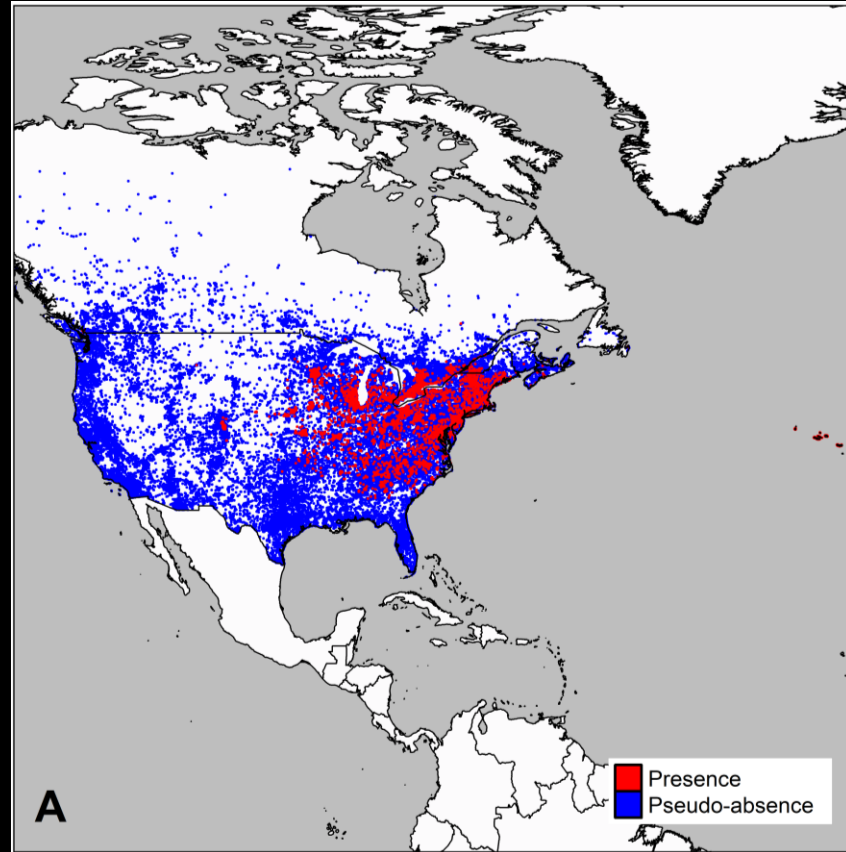

¹ Barbet-Massin *et al.* (2012)

² Genuer *et al.* (2010)

³Freeman *et al.* (2016)

➤ Model training

Train data from **native** and **long-invaded** regions since **newly invaded** regions may reflect dispersal limitations rather than real unsuitability

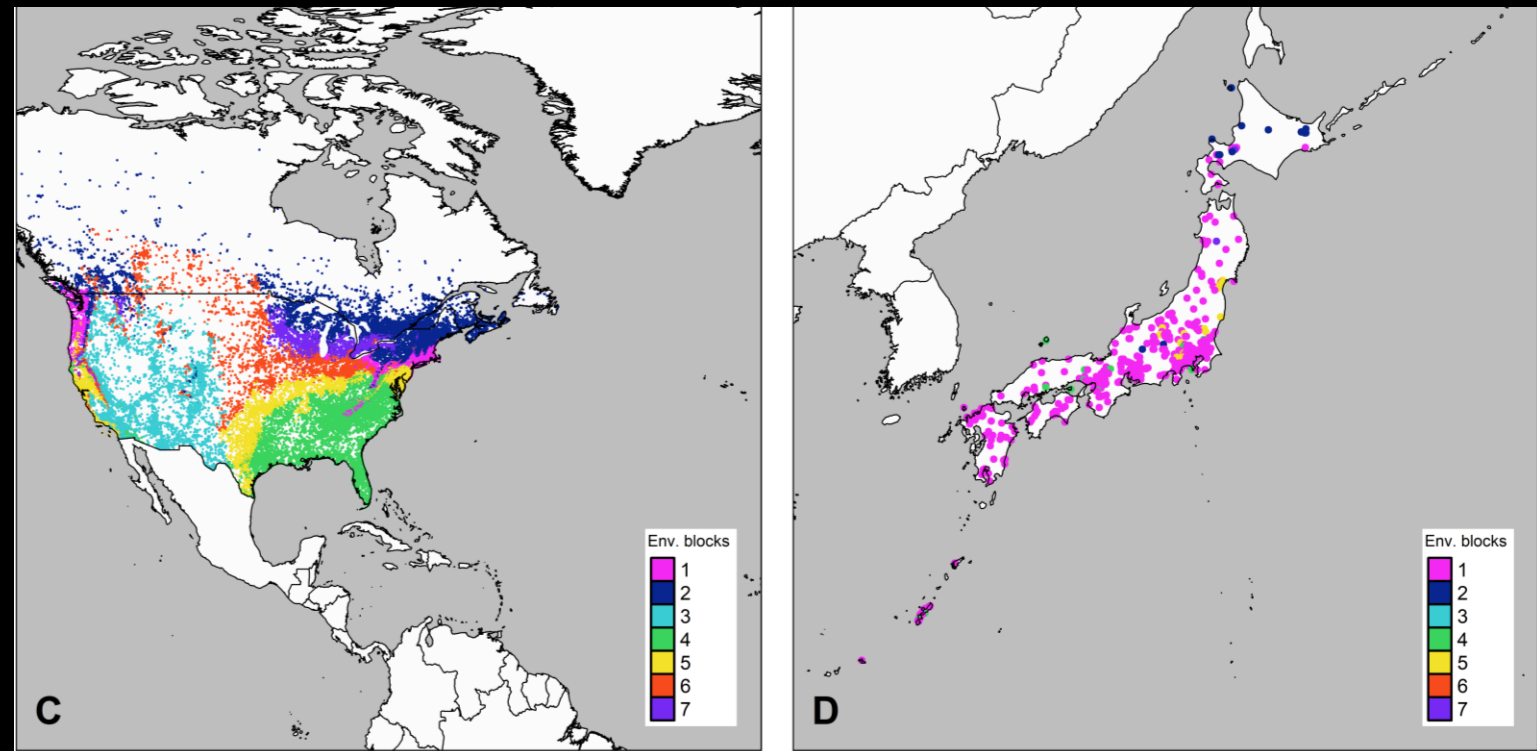

➤ Cross-validation strategy

Dependence structure	Blocking illustration
Spatial	
Temporal	
Grouping	
Hierarchical / Phylogenetic	

Roberts *et al.* (2017)

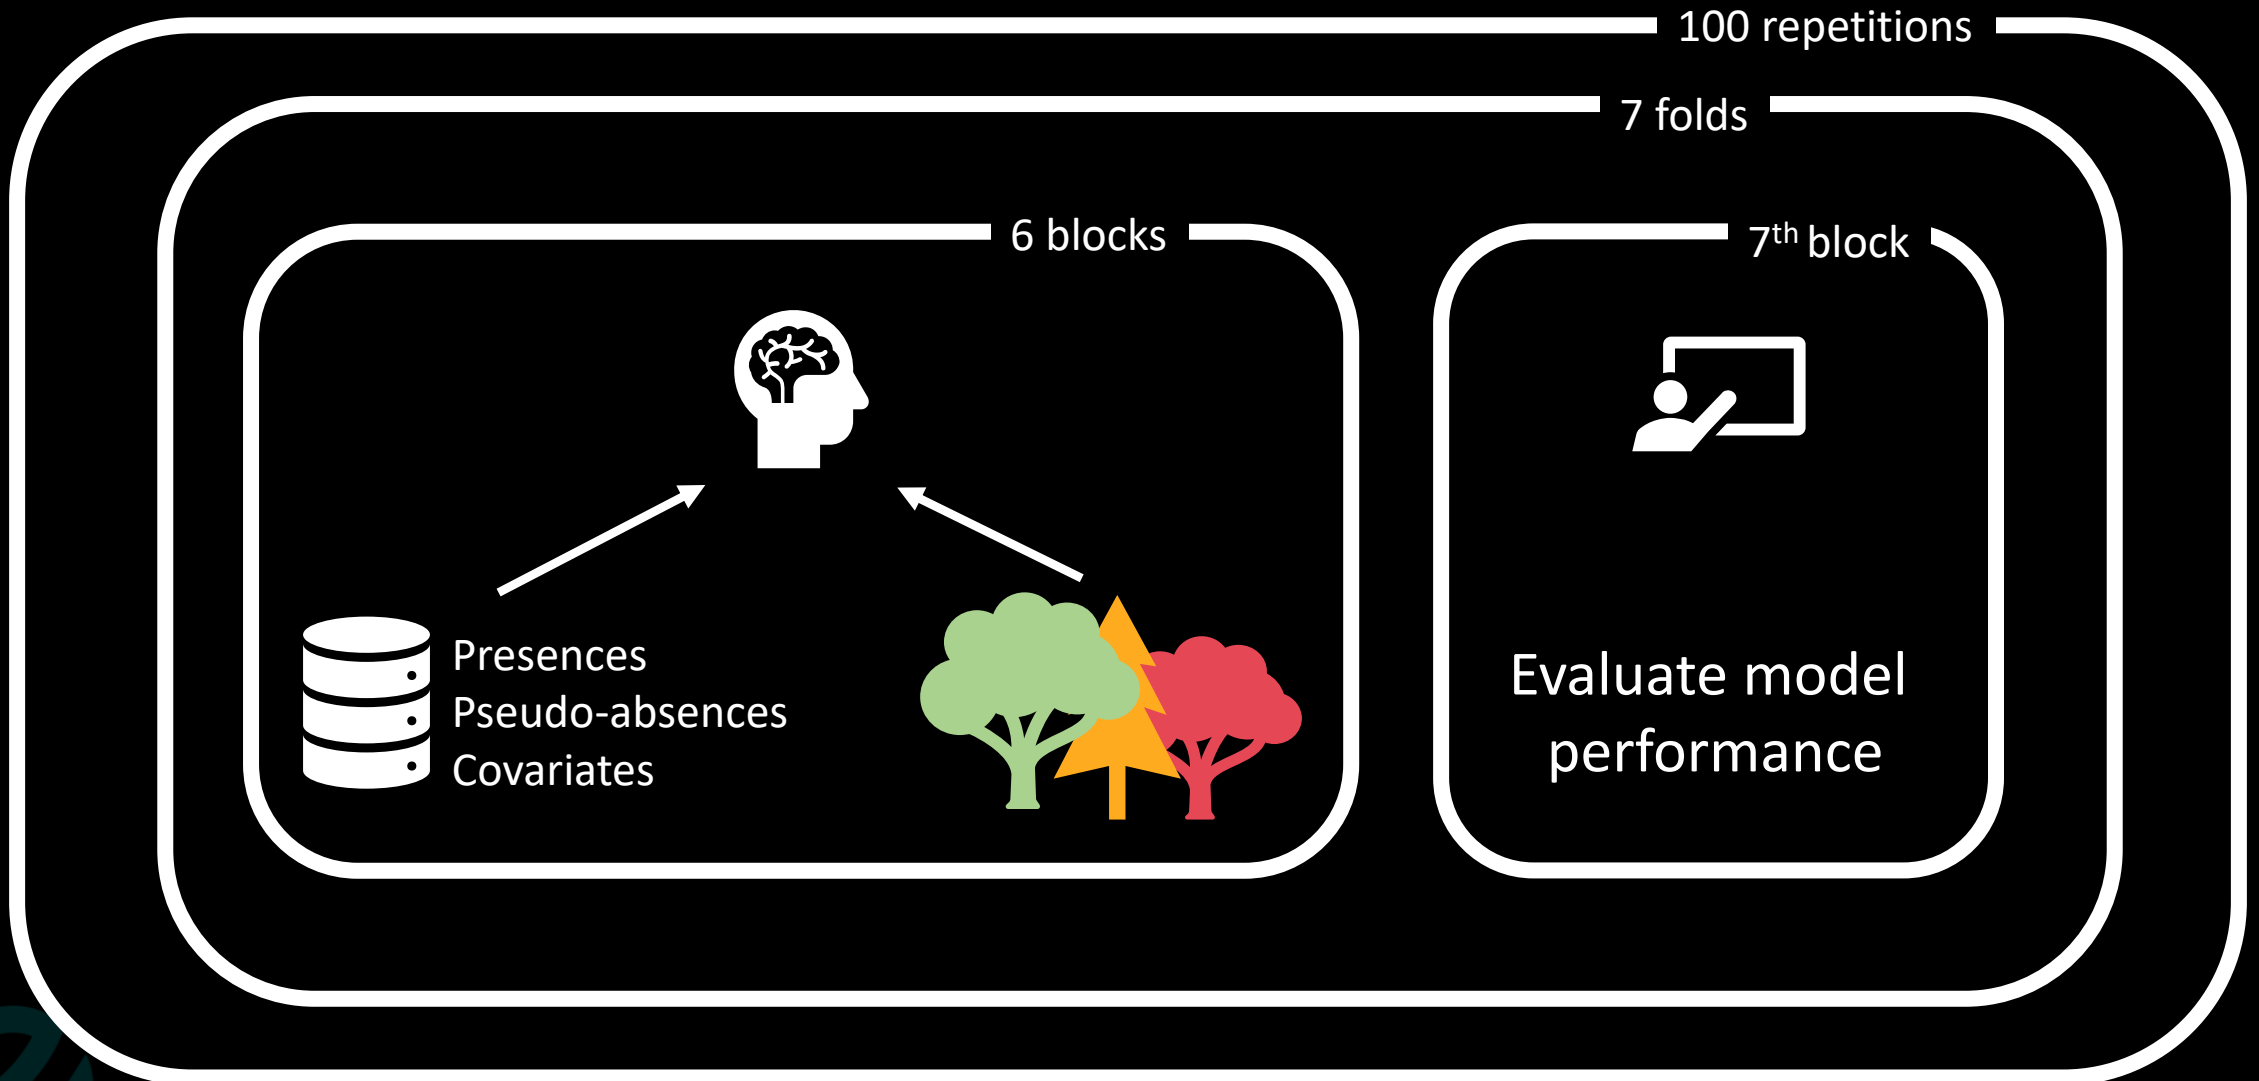

7 blocks according to **environmental** distance

Ploton *et al.* (2020)

Valavi *et al.* (2019)

> Machine learning

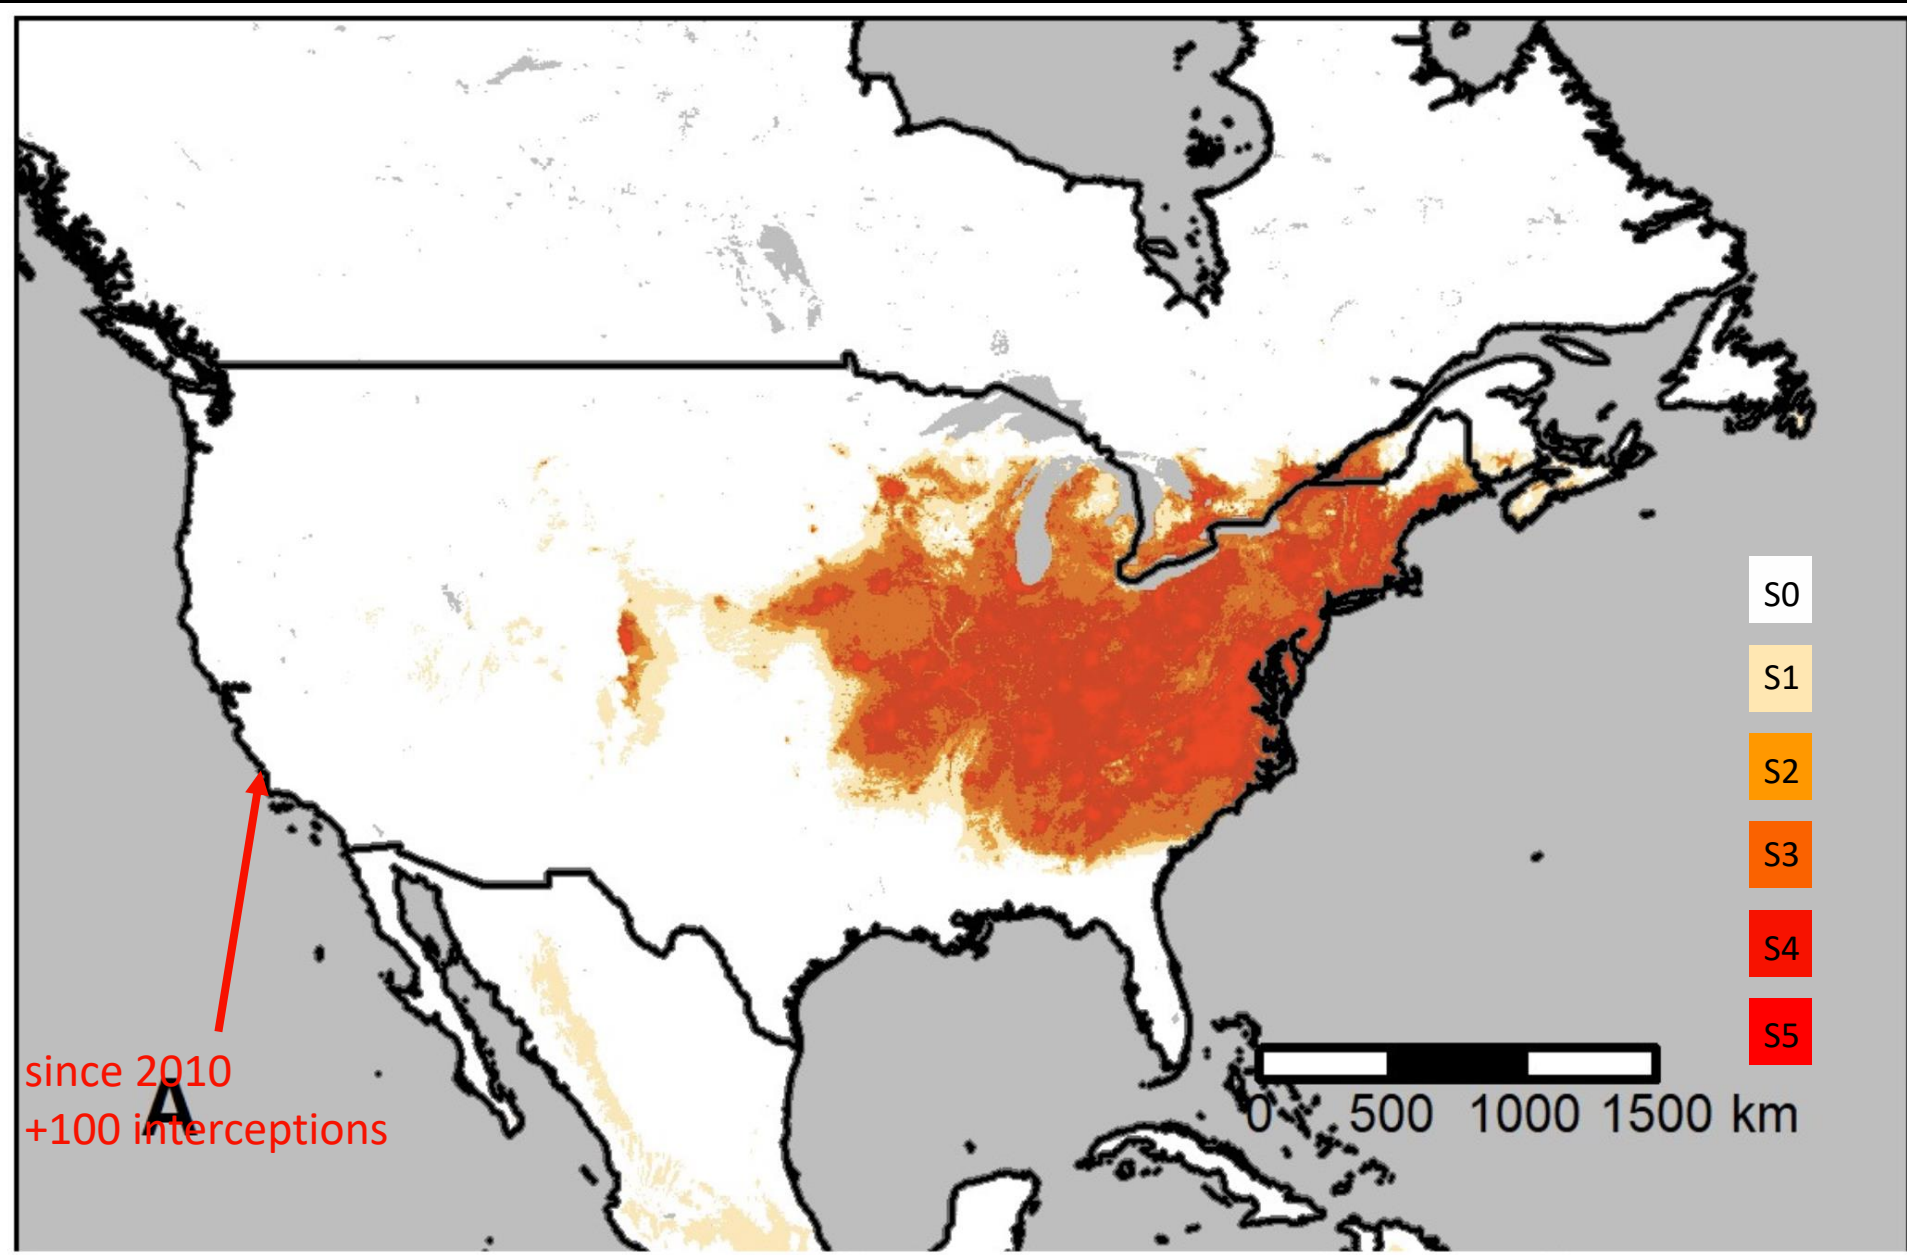

> Predictions

From probability in $[0,1]$ to classes of suitability

➤ Boyce Predicted to Expected ratio (P/E ratio)

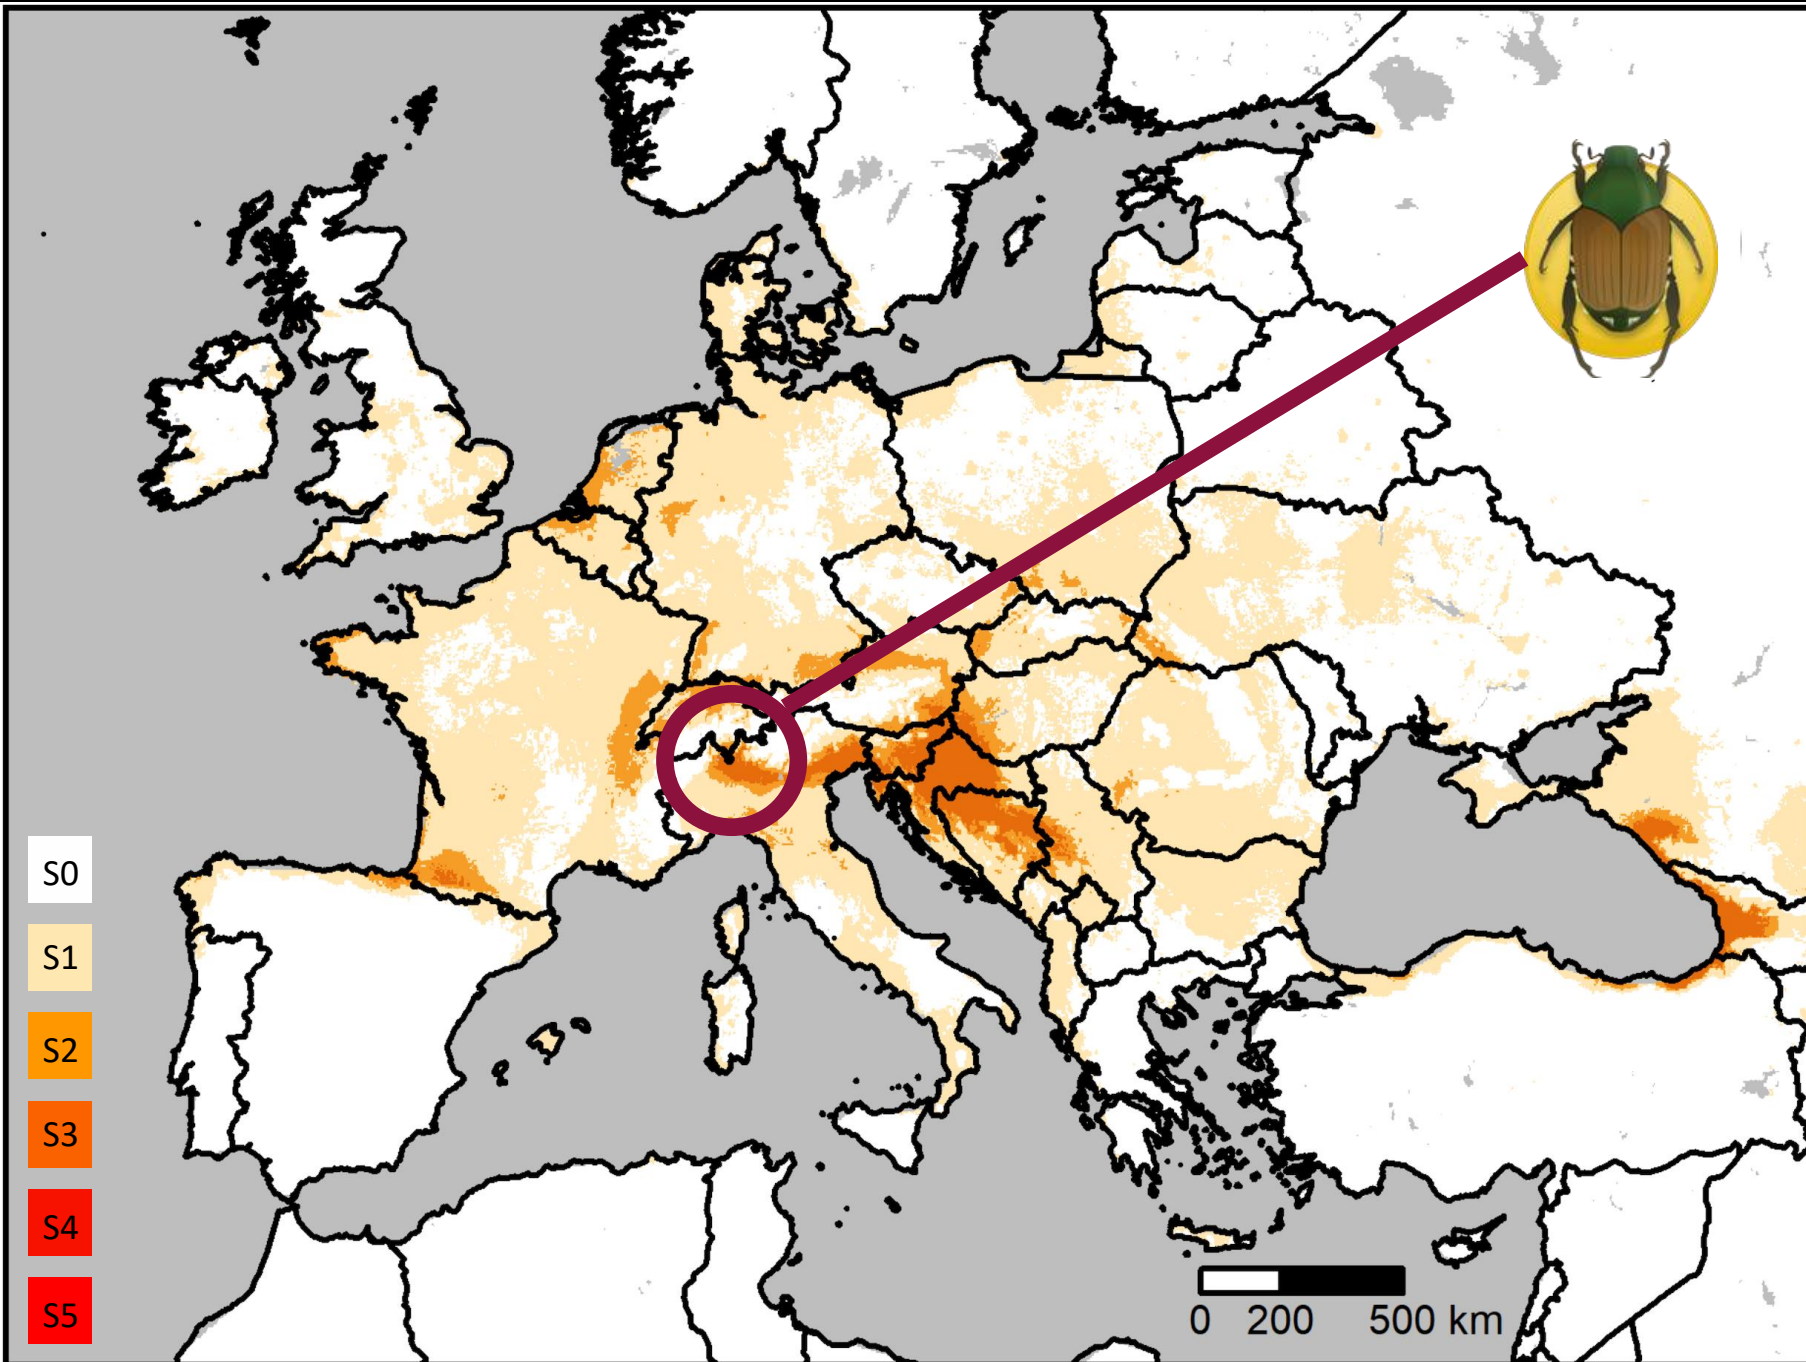

US official classification

✕ = Highly Infested 

⊕ = Infested 

⚠ = Quarantine 

○ = Uninfested

REACTION-DIFFUSION
MODEL
&
OBSERVATION
PROCESS

➤ The reaction-diffusion equation

$$\frac{\partial V(x, y, t)}{\partial t} = DV(x, y, t) + R(x, y)V(x, y)$$
$$V(x, y, 0) = I_{2015}$$

- $V(x, y, t)$ = concentration of PJ in (x, y) at time t
- D = diffusion coefficient
- $R(x, y) = -\frac{1}{\mu} + \sum_{i=0}^5 \beta_i \mathbf{1}_i(x, y)$:
 - μ = life expectancy
 - β_i = birth rate depend on suitability class at location β_i

> Observation process

Legend

-  Administrative boundary
-  Infested = at least 1 PJ found
-  Buffer = <15km from infested

➤ Parameter estimation

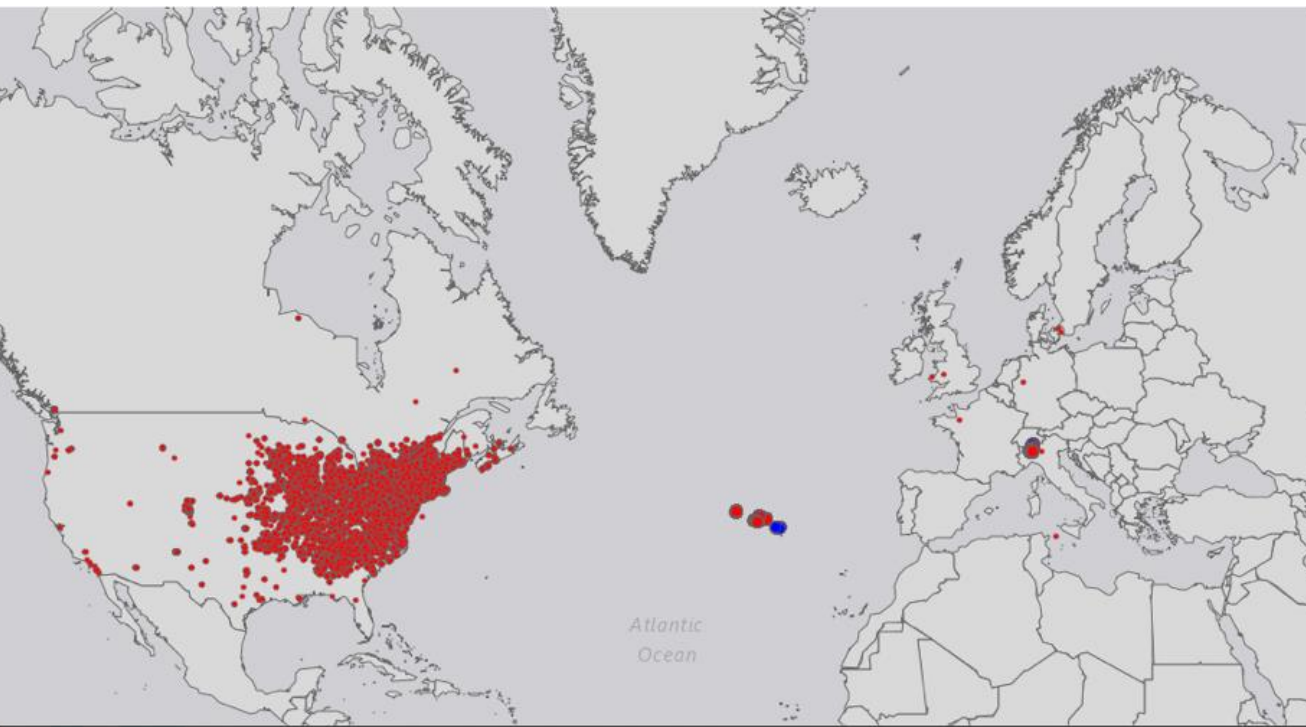

$V(\theta, t)$ for parameter θ at time t
 $\theta = (D, \beta_i)$ = diffusion & birth rate

$O(t)$ = observed presences at time t

Likelihood of θ
=
agreement btw $V(\theta, t)$ and $O(t)$

➤ Presence data

	Official surveillance ¹	Citizen Science ²	TOTAL
Europe	11,777	2,845	14,622
USA & Canada	962	29,498	30,460
TOTAL	12,739	32,343	45,082

Type of data	Count
Presence of PJ	4,206
No observation	9,126,667
TOTAL	9,134,770

Aggregated 4km

¹ From Italy, Switzerland, Portugal, Canada and US

² Including GBIF & iNaturalist web platforms (as of November 2020)

➤ Pseudo-absence data: the target-group method

How to create absence data with the same sampling bias as presence data

Sampling bias in presence-only data from citizen science

- Bias towards of eye-catching, emblematic or newly-introduced species
- Positive bias towards urban & recreational areas and negative bias towards remote areas
- Lack of transect w.r.t. relevant bio-physical factors

Target group method (Ponder *et al.* 2001, Anderson 2003, Phillips *et al.* 2009)

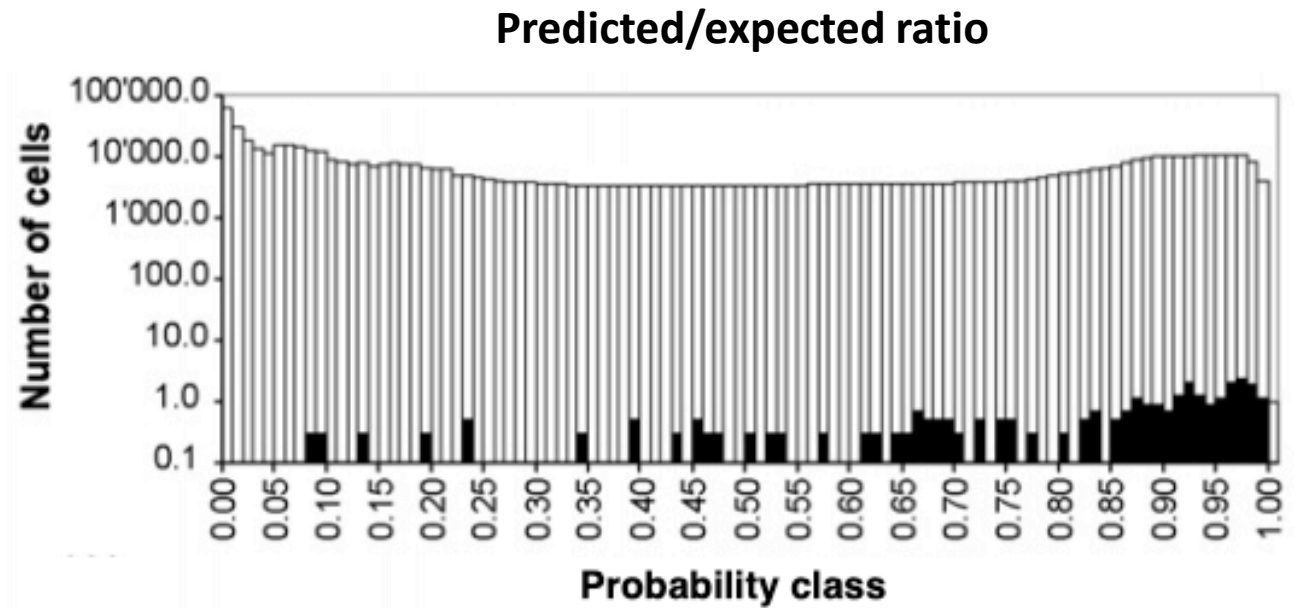

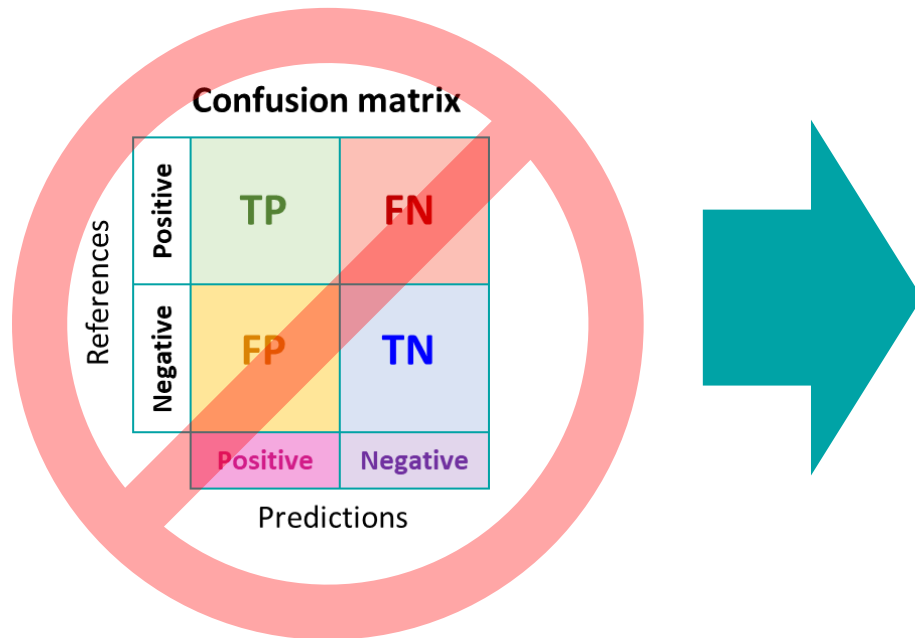

Create pseudo-absences from a set of species that may have the same sampling bias => the target group

For the case of *Popillia japonica*, we used the broader order of *Coleoptera*

Type of data	Count
<i>Popillia japonica</i>	4,206
<i>Coleoptera</i>	49,000
No observation	9,126,667

➤ Validation

No validation measures based on **confusion matrix**:
problems with true negative and false positive

Boyce *et al.* 2002, Hirzel *et al.* 2006
